

Note for all communications between away stations and launch site, these communications should be able to occur without access to internet. So if all our ground stations are on the same WiFi network, everything should be fully functional, regardless of whether we are able to reach google.com, talk on slack, etc

Would be nice if we could get add some sort of audio/video calling to launch site and other away stations on the telemetry computer

Would be nice if we could get connection info (ex signal strength) from the LTU-XR and display it on the telemetry computer

APRS audio is fed through audio cable to computer to be decoded by Dire Wolf. All three devices connected communicate with computer over USB.

Analog VRX can be controlled over USB, both analog and digital video feeds are fed through USB.
